User Stories

1. As a frequent user of Spotify, I want to make a playlist of music I haven't heard so that I can find new music my friends like.

> 1. A page asks for authorization with their account - once accepted they can choose a friend's URI and the user's music will be scanned and compared to the friend's playlists.

2. As a new user of Spotify, I want to get a list of music from a curator that I like so that I can find new music that fit my tastes.

> 2. A page asks for authorization with their account - once accepted they can choose the curator and it will create the playlist for them.

3. As a busy professional who uses Spotify, I want a fast way to make a playlist of music I don't have that I can listen to while I work.

> 3. A page asks for authorization with their account - once accepted they can choose either their friend's URI or a curator and auto create a playlist which can be played back from the browser.

Not Implemented Yet:

4. As a picky music listener, I want to custom select the genres of music while exploring a new playlist of music

> 4. A page asks for authorization with their account - once accepted they can choose either their friend's URI or a curator and auto create a playlist while choosing the genre(s)

Unit Tests (Not Implemented)

- User authorized with correct requirements
- User has music in library or playlists to scan
- Selected user has public playlists to scan
- Scanned libraries will take less than 30 seconds to compile combined (heroku limit)

MVP

1. User authorized with our app
2. User can enter in their friend's URI to scan their music OR
3. User can alternatively select a curator to scan their music
4. Scan through the user music and the friend/curator music removing matches
5. Creates a playlist in Spotify with up to 100 new tracks
6. Able to playback in the browser or in the desktop app
7. Able to easily repeat process
